EDUCATION

Maulana Azad National Urdu Univerity, 10/2021 – 04/2023 | Hyderabad, India
M.Tech in Computer Science
CGPA - 8.95

Government Engineering College, Sreekrishnapuram, 2017 – 2021 | Palakkad, India
B.Tech in Computer Science and Engineering
Cgpa upto 6th Semester - 8.65

EXPERIENCE

Perfotricks, *Software Developer Intern* 04/2021 – 06/2021 | Remote

NEOITO, *Software Development Intern* ☞ 02/2021 – 03/2021 | Trivandrum, India

Perfotricks, *Full Stack Engineer* 07/2021 – 12/2021 | Remote

Full Stack Developer Intern, 02/2022 – 05/2022 | Chennai, Tamilnadu
Velocity Global Solutions India Pvt Ltd.

Highlevel, *Software Developer Engineer* 09/2022 – Present | Remote

TECHNICAL SKILLS

Frontend Frameworks / Libraries — Vue JS, Nuxt JS, React JS, Tailwind CSS, Material UI, Bootstrap, GraphQL, WebPack, **Web Development** — HTML, CSS, JS, **Programming Languages** — Javascript, Python, **Databases** — Redis, MongoDB, Clickhouse, MySql, **Backend Development** — Node JS, Nest JS

LANGUAGES

English Hindi
Malayalam

LEADERSHIP AND ACHIEVEMENTS

Design Lead, *at CodeChef GECPKD Chapter* 11/2020 – 2021

Contribution, *Contributed to Open Source Project*

09/2020 – 12/2021

I created and contributed to Project "DevPad  " as a part of Openhack'20, an open source programme of Foss Cell GECPKD,

Mentor, *at TinkerHub GECPKD*

01/2020 – 2021

PROJECTS

Email Builder

Contributed to the development of the **Email Template Builder** — an intuitive drag-and-drop editor that allows users to design and customize responsive email templates for automation workflows and campaigns. Played a key role in designing the architecture for the **Email Stats Dashboard**, which aggregates performance data from multiple email sources to provide a holistic view of engagement metrics like opens, clicks, and unsubscribes. Additionally, implemented the **Tag Automation** feature that automatically applies tags to contacts based on user interactions, enabling smarter segmentation and targeted follow-ups.

Currently leading the development of **Email AI**, a conversational AI system that empowers users to create and refine email templates directly through a chat interface. With Email AI, users can generate new templates, update themes, translate content, apply tone or grammar improvements, and make design or structural adjustments — all through natural language commands.

Brand Boards

Brand Boards is a unified branding system designed to centralize and manage brand identity across the HighLevel platform. It enables users to define both visual and tonal aspects of their brand, ensuring consistency across all builders and AI-powered tools.

The first subproduct, **Brand Kit**, allows users to create a complete design kit consisting of logos, fonts, and color palettes. These assets integrate seamlessly throughout the platform — logos appear in the logo element and media library, fonts populate font selectors, and brand colors are available in color pickers across all builders. An AI-powered generator can also create a full brand kit automatically from a website URL or brand description.

Additionally, the **Global Custom Colors** feature allows users to define custom color values at the global level. Once created, these colors appear in color pickers across all builders, and any color applied through this feature can later be updated centrally from the settings, ensuring consistent updates across all templates and designs.

The second subproduct, **Brand Voice**, focuses on defining the brand's personality and communication tone. This voice is automatically used across all AI-driven applications within the platform, influencing AI-generated content, chatbot tone, and contextual understanding. The AI system can also generate a brand voice directly from a website URL or brand description, simplifying the process of maintaining consistent messaging across the brand ecosystem.

Perfortricks

Perfortricks is a Vue.js-based web application built with Firebase and BigQuery as the backend stack. It integrates multiple social media advertising platforms, consolidating campaign data into a unified dashboard. The system fetches ad performance metrics and dimensions, enabling users to create custom tables, analyze cross-platform ad insights, and build derived metrics for deeper performance evaluation. This allows marketers to gain a holistic view of ad efficiency across channels through flexible data exploration and reporting tools.
